1 General info

The squizzer software is a framework to provide programmed questions to students. The questions are entered by teachers on an online platform and can be clustered by school year, subject and a topic. They are also tied to different user groups. The students can log into the system and dependent on their user groups they can execute the respective questions. This can be done online via web browsers or via an Android App, which will be downloadable in the Google PlayStore.

The software components are designed to be used by different schools. If a school wants to use the software, they need an apache (or similar) web server with a PHP plugin, a MySQL RDBMS and an URL for the server in order to access the data from the internet. The components are designed in a matter that it should be easy to install the software. However, it is recommended that a minimum of technical skills should be existing by at least one person per school.

2 License

The software is licensed under a Creative Commons Attribution-NonCommercial-ShareAlike 4.0 International License.

3 Prerequisites

Be sure, that you have the following in place before starting the installation:

1	Apache HTTP Server installed with registered domain	
2	PHP (version 5.5 or higher) installed	
3	MySQL server installed	
4	PhpMyAdmin installed (optional)	
5	Root access to the server machine	
6	Root access to the database	
7	school_logo.png	
8	Link to the impressum information of your school	

3.1 Serversoftware

The reference installation was tested on an Apache HTTP Server (Version 2.4.12) with PHP installed and a MySQL database. Be sure that the minimum PHP Version is at least 5.5. However, it is recommended to take the latest versions of the server software anyway. The HTTP server must have a registered domain. For the further explanation this will be the fake domain “www.MyTestSchool.de”.

For the installation process it is recommended to have PhpMyAdmin up and running on your server. If you do not want to manage your MySQL database with PhpMyAdmin it is possible to do the installation via the mysql client as well.

All installation scripts can be found under www.codeconcert.de. If you want to be informed about updates, please ask for being registered in the mailing list by sending a mail to maik.aicher@gmx.net.

3.2 User permissions and settings

For the server side files you need the root access to your server in order to set the permissions correct. For the execution of the database installation scripts, the root access to the database is also needed.

3.3 Additional files

There are two additional things you must provide for a proper presentation of SQuizzer. First you need a school logo, which will be used for the SQuizzer Android App. This must be a 1024x1024 pixel png File and must have the name “`school_logo.png`”.

Another prerequisite is a web address on your domain which holds the impressum information of your school.

4 Installation process

If you have the prerequisites checked, you can start with the installation procedure. Unpack the `SQuizzerInstallation.zip` file to a temporary folder on your server. From now on we assume, that you have copied the files to: `/temp`

4.1 Web server installation

Copy the content of `/temp/SQuizzerInstallationFiles/httpFiles` to your `www` folder. Be sure that you have root privileges in order to set the access rights to the account of the web server. On your `www` folder you should have now a subfolder named “squizzer”.

Now copy the `school_logo.png` file to the folder `www/squizzer/img`. The existing file will be overwritten.

Now the config file must be placed. Here all necessary settings can be made. Because many administrators insist on placing config files outside the application, you can place it anywhere on your system, as long as the web server account has read access to it. In our example the configs are located in `www/appconfigs/`. You must create a subfolder here named “squizzer” and copy the file `/temp/SQuizzerInstallationFiles/configFiles/softwareSettings.php` to `www/appconfigs/squizzer/`

Note: if you have a different directory for you configs, you must open the file `www/squizzer/coreFunctionality/myConfig.php` and adapt the following line:
`include "../appconfigs/squizzer/softwareSettings.php";`
 so that the path leads to the right location.

Now you must set the access rights to the images folder. Go to the folder `www/squizzer/squizzer_images_1` and change the right, so that the webserver can access the folder for opening/reading/writing and creating new subfolder (in Linux this would be `rwxrwx---` or `0770`) and be sure that the webserver has access to the folder (by adding the folder to the correct group or set the owner to the webserver user).

4.2 Database installation

The installation process is described using PhpMyAdmin. If you use the mysql client, you can follow the steps as well – you just have to execute the commands with the right syntax. Check the MySQL manual for detailed description of the mysql client.

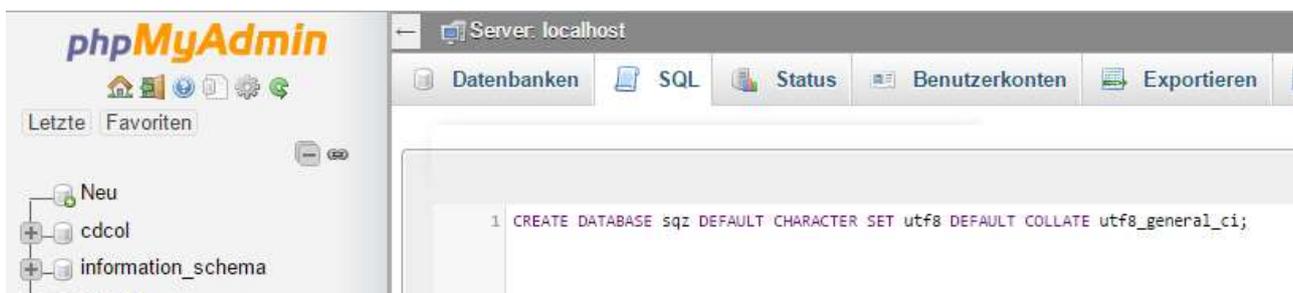

Open PhpMyAdmin and log in as the root user. Open the file `/temp/SQuizzerInstallationFiles/configFiles/CreateDb_squizzer.sql`

This file has two functions. First it holds all necessary commands you must execute manually and it is a script that can be imported by PhpMyAdmin for the automatic steps.

First you must create the database. Copy the following database creation line:

```
CREATE DATABASE sqz DEFAULT CHARACTER SET utf8 DEFAULT COLLATE utf8_general_ci;
```

and copy it into the “SQL” tab field:

Now click on “GO”. You should see a  in the reply message.

You must click now on the newly created database “sqz” in order to select it:

At the top of phpMyAdmin window you will now see the selected database: 

Now you will have to import the file:

/temp/SQuizzerInstallationFiles/configFiles/CreateDb_squizzer.sql

To do this you must click on the  **Import** tab and select the CreateDb_squizzer.sql file by selecting it with the respective button, check the settings (as shown below) and click “GO”:

Importing into the database "sqz"

File to import:

File may be compressed (gzip, bzip2, zip) or uncompressed.
A compressed file's name must end in `.[format].[compression]`. Example: `.sql.zip`

Browse your computer: CreateDb_...izzer.sql (Max: 2,048KiB)

Character set of the file:

Partial import:

Allow the interruption of an import in case the script detects it is close to the PHP timeout limit.
(This might be a good way to import large files, however it can break transactions.)

Skip this number of queries (for SQL) starting from the first one:

Other options:

Enable foreign key checks

Format:

Format-specific options:

SQL compatibility mode:

Do not use AUTO_INCREMENT for zero values

This action should be replied with a  symbol as well.

The next step is to create the application user on the database. For this, go to the “SQL” tab again copy the following line from `CreateDb_squizzer.sql`:

```
CREATE USER 'SqzApplication'@'localhost' IDENTIFIED BY 'secretpassword';
```

Adapt the password to a secret one and click on “GO”. The last thing is to copy the grants to the “SQL” tab, by copying the following lines and execute them with “GO”:

```
GRANT SELECT, INSERT, UPDATE, DELETE ON sqz.sqz_questanswer TO 'SqzApplication'@'localhost';
GRANT SELECT, INSERT, UPDATE, DELETE ON sqz.sqz_questblock TO 'SqzApplication'@'localhost';
GRANT SELECT, INSERT, UPDATE, DELETE ON sqz.sqz_question TO 'SqzApplication'@'localhost';
GRANT SELECT, INSERT, UPDATE, DELETE ON sqz.sqz_questisusergroup TO 'SqzApplication'@'localhost';
GRANT SELECT, INSERT, UPDATE, DELETE ON sqz.sqz_user TO 'SqzApplication'@'localhost';
GRANT SELECT, INSERT, UPDATE, DELETE ON sqz.sqz_usergroup TO 'SqzApplication'@'localhost';
```

```
GRANT SELECT, INSERT, UPDATE, DELETE ON sqz.sqz_userisusergroup TO 'SqzApplication'@'localhost';
GRANT SELECT ON sqz.sqz_quest_per_user TO 'SqzApplication'@'localhost';
GRANT SELECT ON sqz.sqz_v_questanswer TO 'SqzApplication'@'localhost';
GRANT EXECUTE ON FUNCTION sqz.GET_GROUPS_OF_QUESTION TO 'SqzApplication'@'localhost';
GRANT EXECUTE ON FUNCTION sqz.GET_GROUPS_OF_USER TO 'SqzApplication'@'localhost';
GRANT EXECUTE ON FUNCTION sqz.GET_VERSION_OF_BLOCK TO 'SqzApplication'@'localhost';
GRANT EXECUTE ON FUNCTION sqz.GET_VERSION_OF_USER TO 'SqzApplication'@'localhost';
GRANT EXECUTE ON FUNCTION sqz.GET_GROUPS_OF_BLOCKS TO 'SqzApplication'@'localhost';
```

Again, we are expecting the  symbol.

4.3 Configuration settings

Now the settings on the `www/appconfigs/squizzer/softwareSettings.php` file must be done. Look for the parameter name and change as described. For example, if you have to change the parameter “SCHOOL_NAME” to “myTestSchool”, search for it in the `softwareSettings.php` file and change it like this:

```
define('SCHOOL_NAME', 'myTestSchool');
```

	Parameter name:	Value:
1	SCHOOL_NAME	The official name of your school, how you want to have it displayed in the Android app.
2	SCHOOL_IMPRESSUM_LINK	Link to your impressum page. Example would be <code>www.MyTestSchool.de/impressum.html</code>
3	SQL_PASSWORD	This must be identical with the password you entered in the CREATE USER statement.
4	SQZ_LANG	There are two languages supported – for English put ‘en’ and for german put ‘de’ into the field.

4.4 First login

The web address is now your domain (e.g. www.MyTestschool.de/squizzer). This is valid for the user login as well as the connection address of the Android app.

The default user for administration is “admin” and the default password is also “admin”. Now log into your system with

Username: admin

Userpassword: admin

It is highly recommended to change the admin password first. For this click on “my data” in the menu and change the password:

Personal data of admin

Alias:	<input type="text" value="admin"/>
New password:	<input type="password" value="•••••"/>
Rep. Password:	<input type="password" value="•••••"/>
Curr. Password:	<input type="password" value="•••••"/>
Show alias:	<input type="checkbox"/>

[send](#) [delete my account](#)

Congratulations – you have installed the server software of SQuizzer! Now you can start to create the user and set up the user groups, categories and create the questions.

Any further information can be found in the help pages of your SQuizzer installation.
